

INTERCONNECTING LARGE AREA DISPLAY PANELS

Abstract of the Disclosure

A display made from a display panel and a circuit board that are surface mounted to one another. The surface mount interconnections may be distributed across the display avoiding the need to situate the contacts around the periphery. Particularly, in large area displays made up of a plurality of abutting displays, making interconnections in the peripheral areas may be disadvantageous. The row and column contacts may be redundant to improve the yield and life time of the display. Contacts adjacent edges may be displaced into available space, spaced away from the edges.
